

Runtime Bytecode Transformation for Smalltalk

Marcus Denker (University of Berne, Switzerland)
Stéphane Ducasse (University of Berne, Switzerland)
Éric Tanter (University of Chile)

Motivation

- Runtime transformation needed for
 - Adaptation of running systems
 - Tracing / debugging
 - New language features (MOP, AOP)

ByteSurgeon

- Library for bytecode transformation in Smalltalk
- Full flexibility of Smalltalk: Runtime
- Provides high-level API
- For Squeak, but portable

Why Bytecode?

- No need to change the VM
- No source needed
- Other languages possible
- Performance

Examples

Counts the number of Bytecodes:

InstrCounter reset.

Example **instrument**: [:instr | InstrCounter increase]

Counts the number of Sends:

InstrCounter reset.

Example **instrumentSend**: [:instr | InstrCounter increase]

Introspection:

(Example>>#aMethod) instrumentSend: [:**send** |
Transcript show: **send** selector printString]

Transformations

Modification: inlining of code

`insertBefore:`, `insertAfter:`, `replace:`

```
(Example>>#aMethod) instrumentSend: [ :send |  
    send insertAfter: 'InstrCounter increase']
```

```
(Example>>#aMethod) instrumentSend: [ :send |  
    send insertAfter: 'Transcript show:', send selector printString].
```

User-defined Variables

Concatenate strings:

```
(Example>>#aMethod) instrumentSend: [ :send |  
    send insertAfter: 'Logger logSend:' , send selector printString]
```

Poor man's quasi-quoting:

```
(Example>>#aMethod) instrumentSend: [ :send |  
    send insertAfter: 'Logger logSend: <: #sel> '  
    using: { #sel -> send selector }
```

Metavariables

- Goal: extend a send with after logging
- Problem: How to access receiver and args?
- Solution: metavariables

```
Example instrumentSend: [ :s |  
    m insertAfter: 'Logger logSendTo: <meta: #receiver> '  
]
```

#receiver, #arguments, #argn, #result....

#value, #newvalue

Implementation

The Smalltalk Compiler:

Backend of NewCompiler:

Examples

- MethodWrapper with ByteSurgeon
 - 40 lines of code
 - Slower on install (factor 6)
 - Faster on execution (factor 5.3)
- A very simple MOP (MetaObject Protocol)

Simple MOP

- Goal: Control instance variable access
- Code for a trace metaobject:

```
TraceMO>>instVarRead: name in: object
```

```
| val |
```

```
val := object instVarNamed: name.
```

```
Transcript show: 'var read: ', val printString; cr.
```

```
^val.
```

```
TraceMO>>instVarStore: name in: object value: newVal
```

```
Transcript show: 'var store: ', newVal printString; cr.
```

```
^object instVarNamed: name put: newVal.
```

MOP

```
MOP class >>install: mop on: aClass
| dict |
dict := Dictionary newFrom: #mo -> mop.
aClass instrumentInstVarAccess: [:instr |
    dict at: #name put: instr varname.
    instr isRead
        ifTrue: [instr replace: '<: #mo> instVarRead: <: #name> in: self'
                using: dict ]
        ifFalse: [instr replace: '<: #mo> instVarStore: <: #name>
                in: self value: <meta: #newvalue>' using: dict]
]
```

A simple MOP in <10 lines

Benchmark

Recompilation Vs. ByteSurgeon:

	time	factor
Bytesurgeon	4817	1
standard compiler	9760	2.03
new compiler	33611	6.98

Future Work

- Improvements
 - AST vs. Bytecode
- Applications of ByteSurgeon
 - Geppetto MOP
 - Omniscient Debugger
